# **Mass stabilization of Sampaanalahti bay, Rauma, Finland. Utilisation of forest industry by-products as a binder material for mass stabilization**

Lemminkäinen

# UPM Rauma, Forest industry integrate

- Sampaanala bay, an old waterway transportation route of raw wood to the heart of the integrate.
- Purpose of mass stabilisation – bottom structures for new storage field

# **Stage 1, mass stabilisation of basin A**

**Stabilised area : 3,5 hectares**

**Depth of stabilisation: 3 ... 7 meters**

**Volume of mass stabilisation: 145 000 m<sup>3</sup>**

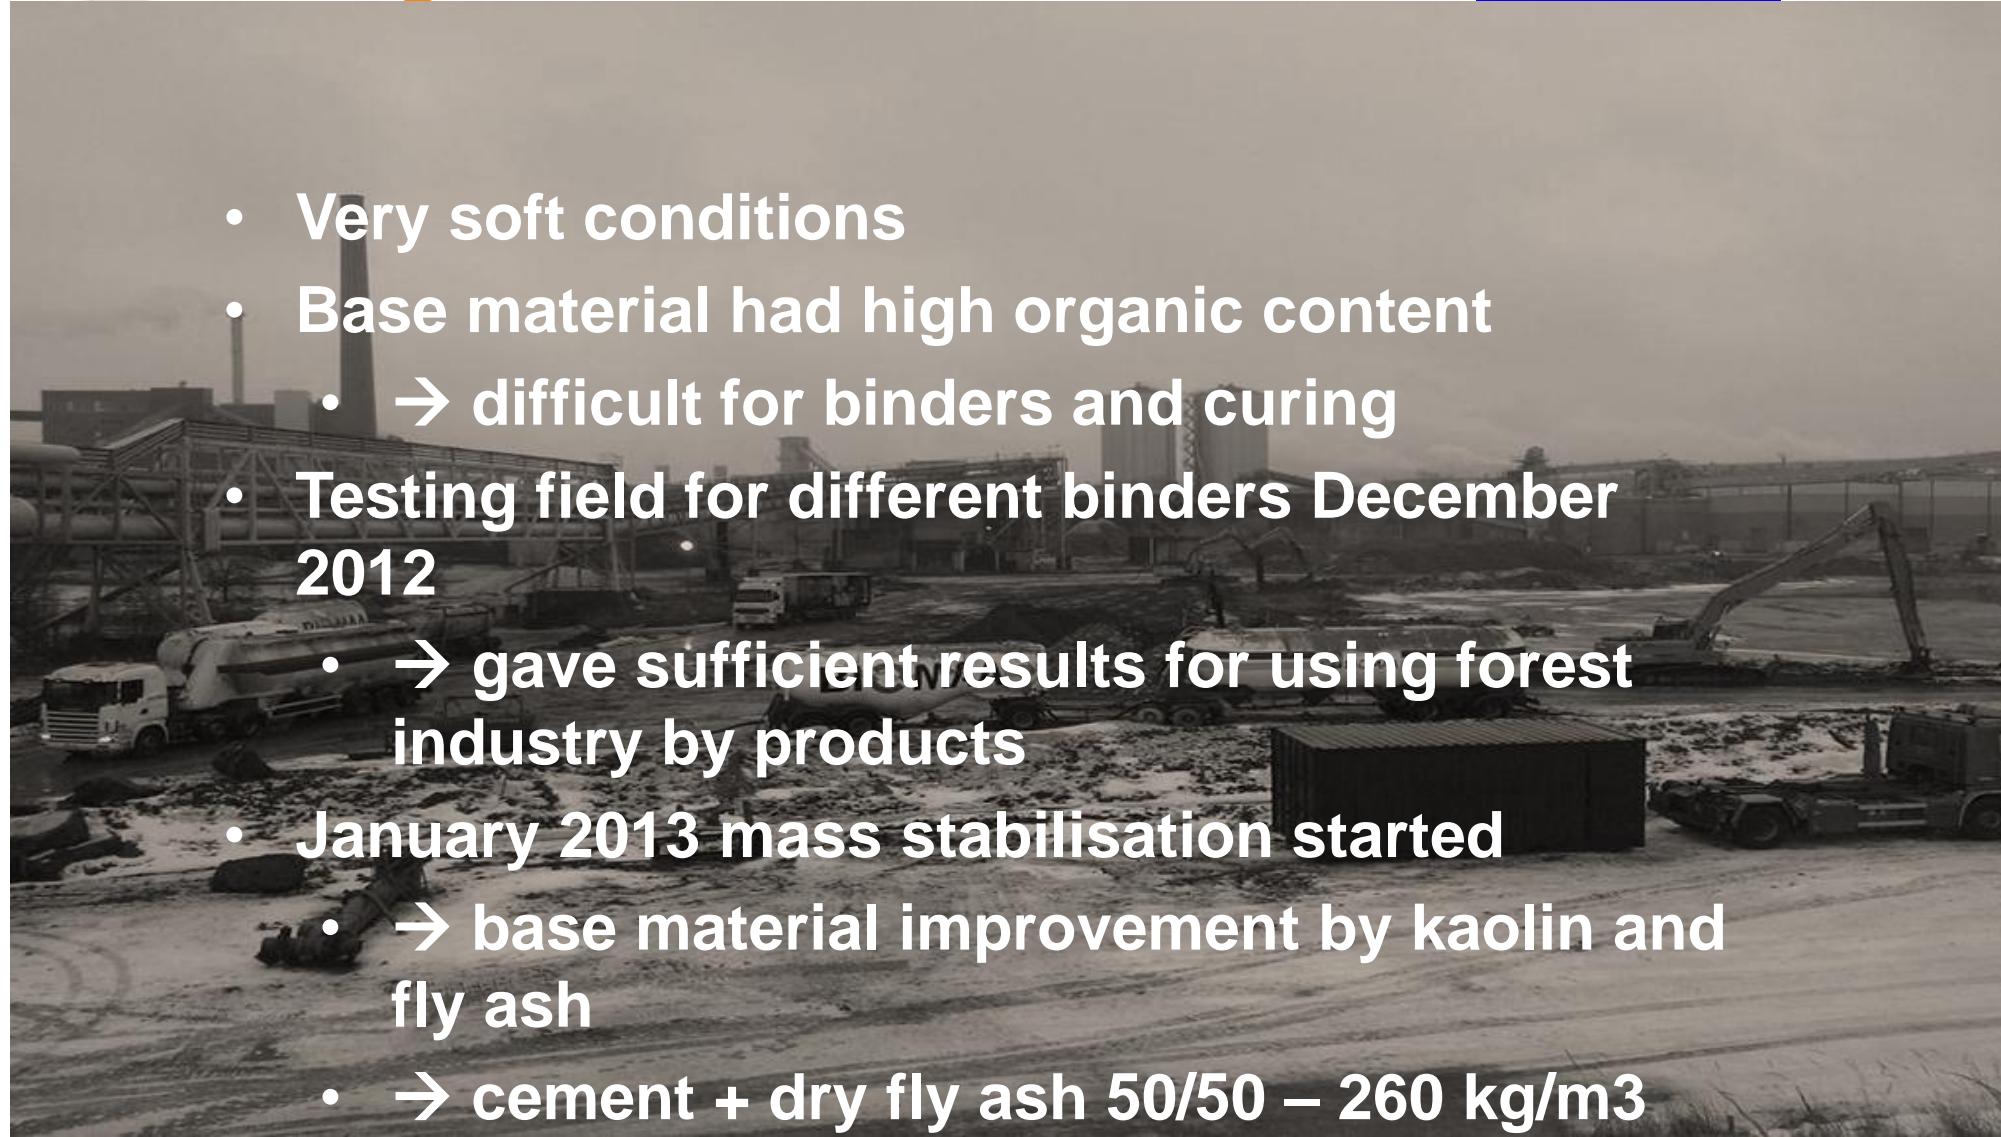

**Preload embankment: 1000 mm**

# Stage 1, mass stabilisation of basin A

- Very soft conditions
- Base material had high organic content
  - → difficult for binders and curing
- Testing field for different binders December 2012
  - → gave sufficient results for using forest industry by products
- January 2013 mass stabilisation started
  - → base material improvement by kaolin and fly ash
  - → cement + dry fly ash 50/50 – 260 kg/m<sup>3</sup>

# Stage 1, mass stabilisation of basin A

- Working order:
  - Screening the debris (wood, cables, etc)
  - Improving the base material – kaolin, fly ash
  - Pre mixing
  - Mass stabilisation with cement – dry fly ash mix
  - Geotextile installation
  - Preload embankment – fly ash / bottom ash

# Stage 1, mass stabilisation of basin A – binder management

- Cement – daily need appr. 70 ... 100 tn
- Dry fly ash – daily need appr. 150 tn.
- Fly ash and kaolin from UPM monofill storage, distance 15 km – daily need 400 tn.

# Stage 1, mass stabilisation of basin A

- Material flows of stabilising basin A
  - Cement – appr. 15 000 tn
  - Fly ash products – appr. 120 000 tn
  - Kaolin + other – appr. 170 000 tn

# Stage 1, mass stabilisation of basin A

Stage 1, mass stabilisation of basin A and preparation of basin B

## Stage 2, mass stabilisation of basin B

Water pools made to basin B, mass stabilised kaolin clay

## Stage 2, field structures of basin A.
